

Great Gold Mines NL

ABN 44 009 157 439

REPORT FOR THE QUARTER ENDED 31 DECEMBER 2007

INTRODUCTION

Great Gold Mines N.L. (the "Company" or "GNL") is an Australian gold and base metals explorer with significant, strategic holdings in the highly prospective Eastern Goldfields province of Western Australia.

Highlights of exploration completed during the December 2007 Quarter include:

- Mapping suggests Jupiter Mines Limited Mt Mason haematite resource may extend on to Great Gold Mines Mt Bevan tenement.
- Grab sampling reveals multiple horizons of haematite in outcrop of 55-62% Fe from the Mount Bevan tenement.
- SLTZ – drilling continued to identify anomalous gold and base metal.
- Erayinia Joint Venture – ABM Resources reports significant and high grade intercept of 5 metres grading 10.6% Zinc in drill hole ED116 recorded from the northern lens at King prospect

Aggressive field programs have been developed for these zones, with high priority target areas delineated for RAB drilling and soil sampling.

REVIEW OF OPERATIONS

Mount Bevan Iron Ore Project (EL 29/510)

The Mount Bevan Iron Ore Project (formerly known as Four Corners Iron Ore Project) on Exploration Licence 29/510, is located approximately 100km west of Leonora in the central Yilgarn of Western Australia.

The tenement covers a sequence of numerous Banded Iron Formation (BIF) units interbedded with fine shales, sands and other sedimentary units, that dip shallow-moderately (20-50%) towards the east north east. Whilst the presence of secondary remobilized haematite mineralisation has been recognised in units adjacent to the main BIF's since the 1970's, the recently announced inferred resource at Mt Mason by Jupiter Mines Limited on the adjoining tenement has accelerated exploration in the area.

The initial resource declared and reported by Jupiter at Mt Mason stands at 2.2 Million tonnes @ 60.6% Fe. The exact location of the resource is unknown, however the most northerly fence of holes reported by Jupiter to date is situated only 55 - 165 metres south of the Company's tenement boundary. Each hole reported by Jupiter from this fence contains high, near surface, Fe results including:

- MMRC108 18m @ 61.4% Fe,
- MMRC111 25m @ 62.0% Fe & 11 m @ 61.3% Fe and
- MMRC110 7m @ 61.7% Fe, 5m @ 64.3% Fe, 6m @ 61.0% Fe & 11m @ 61.5% Fe

Field mapping during the quarter has confirmed that the main mineralised zone at Mt Mason should extend northward onto the Company's licence in an area of scree and soil cover. In addition two campaigns of mapping and sampling by independent consultants have identified additional, outcropping, haematite rich horizons between the major "Mt Mason" and "Eastern" BIF's to the north and east of the known mineralised horizon at Mt Mason and extending at least 8 kilometres to the north and northwest.

Grab samples collected during these campaigns have continued to return high Fe grades from haematite rich horizons on the eastern flanks of outcropping and subcropping BIF units.

SAMPLE ID	E_MGA Z51	N_MGA Z51	Fe (%)	SiO2 (%)	Al2O3 (%)	P (%)	LOI (%)
MB1	239508	6783775	60.2	5.96	2.85	0.056	4.39

91814	243111	6777666	60.0	5.53	2.47	0.067	5.63
91815	243174	6779192	58.8	7.82	2.61	0.064	4.64
91816	243128	6779367	62.2	3.09	0.78	0.050	6.60
91821	242087	6778794	60.9	7.13	0.84	0.035	4.35
91822	242250	6778597	64.9	2.59	1.46	0.050	2.63

A further suite of 12 samples have been collected with assays for these samples pending completion.

An aeromagnetic survey over the entire Mt Bevan Licence was conducted for the Company by Fugro Survey during 2006. The imagery from this survey clearly shows the major BIF units identified to date, but also highlighted several prospective BIF units with limited surface exposure. The survey also identified prospective zones of cross faulting that appears to be directly related with the development of observed zones of high grade haematite.

Exploration data continues to confirm that the Mt Bevan tenement hosts up to 20km strike length of prospective Banded Iron Formation with secondary haematite development in overlying sediments. The Company is currently in the process of making the necessary arrangements (including booking drill rigs, camp facilities, clearing access tracks, heritage survey and other necessary arrangements) to commence a significant drilling program as soon as possible.

Jumnania Hill

A program of ground EM (electromagnetics) has just been undertaken, processing has been completed and the final report is now being analysed with a view to determining a suitable exploration drilling program.

The prospect area is located within the Yindana tenements and refers to a sequence of rocks that are prospective for volcanogenic base metal deposits as well as gold. The lithological sequence is equivalent to that hosting mineralisation to the south at Erayinia, which is in joint venture with ABM Resources. A significant chert marker horizon is present within the Company's wholly owned tenements, covering a distance of 10 kilometres.

A program of ground EM (electromagnetics) has just been undertaken, processing has been completed and the final report is now being analysed with a view to determining a suitable exploration drilling program. Several magnetic targets have been revealed and will be drill tested later in the year.

Triumph Gold Project

The Triumph group of gold workings is located at Edjudina, 130 kilometres south of Laverton, WA. The old workings lie along a regionally significant mineralised structure. The Company has identified

high priority targets both to the northwest and to the southeast along this structure where internal granites have intruded the sequence, and where the trends are under the cover of recent sediments. This setting is very similar to that at Granny Smith to the north.

RAB drilling was carried out in tenement E31/405. The programme consisted of four holes for 167 metres. Gold values are very low but there were minor anomalous zinc and nickel values. The holes planned in P31/1611, P31/1616, E31/414 and E31/593 remain to be completed. Soil sampling has been carried out on tenements P31/1612 to P31/1615 and P31/1571. Assay results for gold and base metals show a number of geochemically anomalous values which require further investigation.

Anglo Saxon Gold Project

The project area is located 35 kilometres east of the Carosue Dam gold deposit. The Saxon Extended gold resource consists of multiple events of quartz pyrite veining over a distance of at least 1,200 metres and is open to the north, south and at depth.

The existing resource database has been updated, incorporating the last two years drill results. There are at least three regional structural trends containing numerous old gold workings over a distance of 11 kilometres. Previous drilling has intersected widespread gold mineralisation.

Additional lode structures adjacent to previously delineated mineralisation have been discovered and will require further assessment.

RAB Drilling has been carried out in tenements M31/78, M31/79 and M31/113. Eighty eight holes were drilled for a total of 3,198 metres. Gold results were generally low with the best intersections being:

Hole Number	From (m)	Length (m)	Grade (g/t)
PINB776	28	4	0.75
PINB770	12	4	1.64

Pinjin

RAB drilling programs have been carried out in tenements E31/636, E31/425, P31/1546 and P31/1547 of the Pinjin Project. RAB drilling was completed as per summary below:

Tenement	No. Holes	Total metres	No. Assays
P31/1546	12	566	158
P31/1547	8	296	89
E31/425	31	692	692
E31/636	16	227	82

Gold and base metal results were very low.

Yundamindera

The Yundamindera prospect is located approximately 95 kilometres south of Laverton and covers an area of over 400 square kilometres, of which 180 square kilometres is available for exploration. The prospect is located to the south of the major gold deposits of Sunrise Dam, Wallaby, and Granny Smith and occupies a regional corridor with gold prospective lithologies and mineralised structures. A significant structural corridor extends for at least 12km through the Company's tenements.

Previous regional RAB drilling has returned encouraging results, particularly at the Yundamindera 4 prospect. The mineralisation occurs within quartz sulphide veining along the footwall of an east dipping porphyry body, an association that is significant in this region. RAB drilling is planned to test these zones further.

Soil-sampling programs have been completed in tenements E39/812, P39/3691, E39/969, E39/717 and E39/718. Geochemical results indicate low level gold and base metal anomaly are present and require further work to assess the source. RAB drilling was carried out for tenements E39/1046, E39/1047 and P39/3859. RAB drilling was completed as per summary below:

Tenement	No. Holes	Total metres	No. Assays
E39/1046	16	631	186
E39/1047	24	864	260
P39/3859	8	372	110

Minor anomalous gold was found in E39/1047, maximum intersection 8m @ 0.16g/t from 16m. The majority of samples were of very low value to below detection.

Wild Dog Dam

The Wild Dog Dam tenements lie to the south of Anglo-Saxon where regional structures rotate from southeast to a favourable southerly trend. The Company is targeting the continuation of the structural corridor containing prospective lithologies and mineralised structures in this direction. Early drill programs returned up to 4 metres @ 1.88 g/t gold. Elevated copper was also returned from these earlier programs so base metal levels will need to be tested.

The Company has carried out a soil sampling program and regional RAB drilling in E28/1397. Heritage surveys have now been completed over other high priority targets and RAB drilling has also been carried out in tenements E28/1081 and E28/1517. RAB drilling was completed as per summary below:

Tenement	No. Holes	Total metres	No. Assays
E28/1397	104	4834	1413
E28/1081	25	1016	290
E28/1517	20	551	172

Results were generally poor with the best gold values at 10m @ 0.08g/t from 44 in hole YINB894. Three holes indicated the presence of ultramafic units in the sequence with assays of >500ppm nickel over 4 metres.

Yindana

The Yindana tenements are located 100 kilometres east of Kalgoorlie at the southern end of the SLTZ. The Keith-Kilkenny shear zone and associated graben sediments joins with the SLTZ in this area, and both continue in a southerly direction. The Company is targeting these prospective structures and host rocks along these corridors.

RAB drilling has been completed in tenements E28/1073 and E28/1518. RAB drilling was completed as per summary below:

Tenement	No. Holes	Total metres	No. Assays
E28/1073	18	406	130
E28/1518	67	1811	560

In both of these tenements the gold values were very low. In E28/1518 nickel anomalous values were found in holes YINB720, YINB722 and YINB742 indicating the presence of ultramafic lithology.

Savannah

Air core drilling was carried out in the Savannah tenement E31/454. Thirty five holes were completed for 3306 metres and 905 samples were assayed for gold and base-metal. Drilling at this project penetrated through a thick sequence of plastic and non-plastic clay of fluvial/lacustrine lithology and, sometimes via a thick (5-10 metres) sequence of black reduced sands, into weathered Archaean bedrock. Anomalous gold results occurred infrequently in both sandy overburden types and weathered basement. The best of these intersections are:

Hole Number	From (m)	Length (m)	Grade (g/t)
SAVA6	108	6	0.40

SAVA13	72	4	0.11
SAVA27	108	2	0.18
SAVA13	100	4	0.15

Erayinia Joint Venture

Erayinia is a joint venture between the Company (30% interest free carried to decision to commence a feasibility study) and ABM Resources NL. ("ABM"). ABM has reported exploration results for the quarter as follows:

"A very significant and high grade intercept of 5 metres grading 10.6% Zinc in drill hole ED116 recorded from the northern lens at King prospect, Erayinia JV Project. Results from drill hole ED116 show that Zinc grades have increased with depth at King prospect. The Zinc mineralisation remains open at depth. A second VMS lens ("southern") outlined to the south of the northern lens by recent diamond drilling. This lens remains open to depth.

DHTEM surveys undertaken at King, and two other targets E2 (1.5 km north of King) and E14 (10 km north of King). Analysis of the DHTEM data highlights a significant conductive body lying below the high grade Zinc intercept of 5m grading 10.6%, recorded in ED116 at King.

A total of 3,770 metres of diamond drilling were completed at King in the December quarter. Assays from diamond drilling are awaited from three completed holes, all of which intersected Zinc rich sulphide mineralisation."

CORPORATE

During the quarter, Messrs Kerr and Elliott were appointed Directors and Messrs JI Gutnick and MZ Gutnick resigned as Directors. Following this, the Company announced the intention to merge with Ellendale Resources NL by means of a scheme of arrangement and undertook a capital raising of \$4.5 million of which \$1.96 million was received by 31 December 2007 with the balance due following shareholder approval. On 30 January 2008, the Directors announced that the balance of the placement of \$2.54 million had been received and 72,571,428 ordinary shares had been issued.

On 25 January 2008, shareholders approved the merger with Ellendale Resources NL, the appointment of Messrs Kerr and Elliott as Directors, an issue of options to Messrs Kerr and Elliott, an increase in directors fees, ratified the issue of shares over the pasty 12 months, approved the issue of the balance of shares under the capital raising announced in December 2007, the change in the Company's status to a company limited by shares, a new constitution and a change in name to Hawthorn Resources Limited.

On 29 January 2007, the Directors announced that on 24 January 2008 they received a non-binding, confidential approach from a West Australian company seeking to gain control of the Company and replace the capital to be issued by the Company in the second tranche of the recent placement. The proposal also included an intention to further develop the Company's iron ore tenement in Western Australia and dispose of all of the Company's gold assets.

The board gave the proposal careful consideration and determined it was inferior to the capital raising and iron-ore focussed works program it had previously adopted and was not superior to the merger proposal it had previously received from Ellendale Resources NL.

The technical information in this report has been reviewed and approved by Dr D S Tyrwhitt who is a member of the Australasian Institute of Mining and Metallurgy and has approximately 40 years experience in the industry. Attached is a copy of the Company's Mining Exploration Entity Quarterly Report in accordance with Listing Rule 5.3.

Notes

- 1 The quarterly report provides a basis for informing the market how the entity's activities have been financed for the past quarter and the effect on its cash position. An entity wanting to disclose additional information is encouraged to do so, in a note or notes attached to this report.
- 2 The "Nature of interest" (items 6.1 and 6.2) includes options in respect of interests in mining tenements acquired, exercised or lapsed during the reporting period. If the entity is involved in a joint venture agreement and there are conditions precedent which will change its percentage interest in a mining tenement, it should disclose the change of percentage interest and conditions precedent in the list required for items 6.1 and 6.2.
- 3 **Issued and quoted securities** The issue price and amount paid up is not required in items 7.1 and 7.3 for fully paid securities.
- 4 Appendix 5B has been prepared in accordance with Australian Accounting Standards (AASBs) (including Australian Interpretations) adopted by the Australian Accounting Standards Board.
- 5 **Accounting Standards** ASX will accept, for example, the use of International Accounting Standards for foreign entities. If the standards used do not address a topic, the Australian standard on that topic (if any) must be complied with.

Mining exploration entity quarterly report

GREAT GOLD MINES N.L.
ABN 44 009 157 439

For the Quarter Ended 31.12.2007
(referred to in this Statement as the “Current Quarter”)

Additional Information

Item 1.23 Payments to Other Entities

One of the Directors of the Company is also a Director of AXIS Consultants Pty. Ltd. (“AXIS”). The Company does not consider AXIS to be a related party.

Item 7.7 Options

Listed

13,716,713 options maturing September 22, 2010 at an exercise price of \$1.25 per option. Each option will convert into one ordinary share.

165,084,231 options maturing February 28, 2013 at an exercise price of \$0.10 per option. The options are exercisable any time after January 1, 2004. Each option will convert to one fully paid ordinary share.

13,569,422 options maturing April 30, 2012 at an exercise price of \$0.20 per option. The options are exercisable any time after January 1, 2003. Each option will convert to one fully paid ordinary share.

Unlisted

6,000,000 options maturing on October 19, 2011, issued under the 2005 employee share option plan, have an exercise price of \$0.10 per option. Upon exercise, each option will convert into one fully paid ordinary share. These options cannot be exercised until after October 19, 2008 other than on a change of control.

Subsequent Events

On 30 January, the Company completed tranche 2 of the placement announced on 13 December 2007 and issued 72,571,428 shares, raising \$2,540,000.
